

Specification

Weight	250g
Size	7cm by 4cm
Capacity	100 mlts
Material	Anodised Aluminium
Magnet force	7 Kilos
Holes variable	0 — 18 * 3mm diameter
Hole Sizes perf'	48 * 3mm diameter

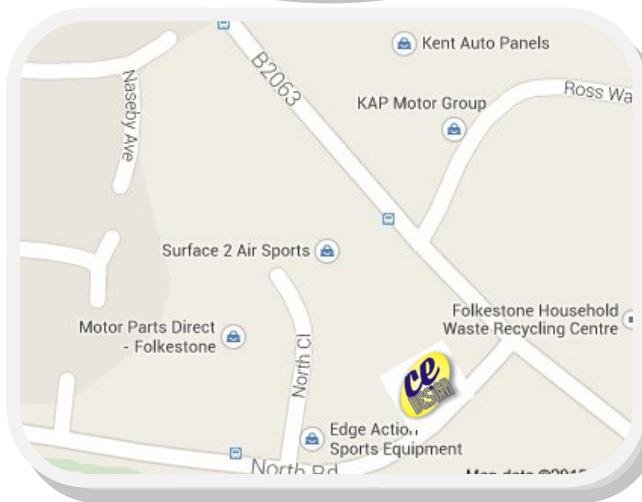

Imprint Training

These scent boxes are designed to fit into our carousels. Where they can be desensitised and imprinted for removal into an operational environment for continued training.

Cleaning and sterilising

We recommend cleaning in boiling water without detergents and keep boxes assigned to individual odours to avoid cross contamination. Boxes can be numbered or engraved on the rear for identification. When visually exposed it's helpful to use a blank as a control. Particularly working with more visual dogs. This eliminates false positives and encourages olfactory functions.

Compact Scent Box

These compact scent boxes are easy to hide compared to the larger boxes and present a more olfactory based search, as dogs soon learn to cheat if they can see bulky boxes. These magnetic scent boxes come as a set of two with muslin bags and ferrous hanging kit.

Design

Billet machined from aircraft aluminium and anodised for protection against corrosion.

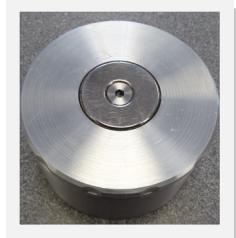

Manufactured in two different styles either fully perforated or variable control release.

Both boxes incorporate a magnetic screwed cap to allow access to the scent chamber .They have an internal capacity of 100mlts and designed to administer small amounts of odour.

The magnetic cap allows you to attach the scent box to anything steel. It also allows you to attach stainless hooks from our hanging kit. This kit allows the scent box to be attached to almost any material.

Hanging Kits: Contain 3 different styles of stainless hook and double sided disc. This allows the scent box to be used in any location and hung on any material and not limited to locations that are predominantly steel such as vehicles, prison cells or ships!

Odour Release System

The variable scent box controls the escaping odour by moving the lever to the required number of holes in the display.

- 0 = Closed
- 3 = 0.5% by surface area
- 9 = 2.0% by surface area
- 18 = 4.0% by surface area

The fully perforated scent box is pre-set to 10% by surface area.

Please note the settings are just a guide and based on the restriction of vapour released through the perforations and makes no allowances for the odour strength, volume or surface area of the material. Other factors may include air flow, temperature and humidity.
